Customer Journey Map — F1 Race Intelligence

Date: 1 November 2026 | Team ID: Not provided — enter the official assigned Team ID before submission | Project: F1 Race Intelligence: Formula 1 Performance Analytics using Tableau

Primary persona and journey

Persona: F1 performance strategist Rajan (project design persona). Goal: answer a performance question quickly and confidently. The map below is a design hypothesis, not a result of formal user interviews.

Journey stages

Stage 1 — Define question: Actions: choose driver/team/season/circuit question. Touchpoint: project website and report. Thought: “Which comparison do I need?” Feeling: focused but time-constrained. Owner: analyst. Improvement: show project purpose and source links clearly.

Stage 2 — Explore Tableau: Actions: open Story1, inspect charts, use available filters/tooltips. Touchpoint: Tableau Public. Thought: “What pattern is visible and what does the measure mean?” Feeling: more confident if labels are clear. Owner: project author maintains workbook. Improvement: consistent units, explanatory subtitles and filter defaults.

Stage 3 — Interpret and communicate: Actions: verify chart context, compare with source records, explain finding and caveat. Touchpoint: dashboard/story, report and demo video. Thought: “Is this comparison fair and traceable?” Feeling: confident when limitations are visible. Owner: analyst/presenter. Improvement: link every claim to a chart and document missing-value handling.

Pain points and opportunities

Pain: data is distributed across multiple sheets; nulls can be misinterpreted; season and circuit contexts matter; published chart inventory and calculated fields need verification.

Opportunity: add a chart glossary, explicit data provenance, a “known limitations” note, accessible colors, and a repeatable QA checklist before publication.
