Problem–Solution Fit — F1 Race Intelligence

Date: 1 November 2026 | Team ID: Not provided — enter the official assigned Team ID before submission | Project: F1 Race Intelligence: Formula 1 Performance Analytics using Tableau

1. Customer segments

F1 performance strategist; motorsport broadcast analyst; technical regulation/reliability analyst; project evaluator. Personas are scenario-based, not interview participants.

2. Jobs-to-be-done / problems

Compare championship metrics, qualifying pace, lap/sector times and DNF records; prepare clear evidence for decisions or broadcast storytelling. Manual sheet-by-sheet comparisons take time and can lose context.

3. Triggers

Race weekend preparation, post-race analysis, editorial graphics, reliability review, academic project demonstration.

4. Emotions before / after

Before: time pressure and uncertainty. After: more confidence when views are labelled, contextualized and traceable. This is a hypothesis to test with users.

5. Available solutions

Spreadsheets, separate results pages, static tables and independent charts. They provide detail but can require manual joining and interpretation.

6. Customer constraints

Limited time, different analytics skill levels, changing regulations, missing fields, public hosting limits and no verified live feed/Snowflake warehouse.

7–8. Behaviour and channels

Users open the website or Tableau story, select relevant views, inspect tooltips and compare records. Channels: Tableau Public, GitHub Pages, repository README, report and demo.

9. Root cause

Related records are spread across different sheets; visual summaries need clear aggregation; missing values and provenance can be misunderstood.

10. Proposed solution

A Tableau-based visual story linked from a static GitHub Pages site, supported by data profiling and documentation. Fit hypothesis: reduce manual comparison effort and improve explainability. Validate through usability testing; do not claim proven impact without evidence.
